

Debugging in 132-column mode - A Technical Tip

submitted by [Steve Kontos](#).

You can run the ILE debugger in 132 column mode. Using the Add Environment Variable command, enter the variable ILE_DEBUGGER_1 with the value ALLOW_WIDE_SCREEN as shown below:.

```
0.....1.....2.....3.....4.....5.....6.....7.....8
1234567890123456789012345678901234567890123456789012345678901234567890
      ADDENVVAR  ENVVAR(ILE_DEBUGGER_1) +
                VALUE(ALLOW_WIDE_SCREEN) LEVEL(*JOB) +
                REPLACE(*YES)
```

To turn off wide debugging, simply use the remove (RMVENVVAR) command. Note: the debugger here is the one you get by using the **STRDBG** command and this works from (at least) V5R1 on. Enjoy!
